

## ▼ Module 3 Lab Exercise: Machine Learning Workflow and Types of Learning

### Learning Objectives

By the end of this lab, you will be able to:

- Distinguish between supervised, unsupervised, and reinforcement learning
- Understand the complete machine learning workflow
- Build and evaluate your first classification model
- Work with different types of data (numerical, categorical, text, images)
- Apply the end-to-end ML process: data → model → evaluation → insights

### Prerequisites

- Completed Module 2 (familiar with Python libraries and Jupyter/Colab)
- Understanding of basic data operations and visualization
- Access to your GitHub repository for saving work

## Part 1: Understanding Types of Machine Learning

Machine learning can be categorized into three main types. Let's explore each with practical examples.

### 1. Supervised Learning

**Definition:** Learning from labeled examples to make predictions on new, unseen data.

**Examples:**

- **Classification:** Predicting categories (spam/not spam, disease/healthy)
- **Regression:** Predicting continuous values (house prices, temperature)

**Key Characteristic:** We have both input features (X) and correct answers (y) during training.

### 2. Unsupervised Learning

**Definition:** Finding hidden patterns in data without labeled examples.

**Examples:**

- **Clustering:** Grouping similar customers for marketing
- **Dimensionality Reduction:** Simplifying complex data while keeping important information

**Key Characteristic:** We only have input features (X), no correct answers during training.

### 3. Reinforcement Learning

**Definition:** Learning through trial and error by receiving rewards or penalties.

**Examples:**

- Game playing (chess, Go)
- Autonomous vehicles
- Recommendation systems that learn from user feedback

**Key Characteristic:** Agent learns by interacting with an environment and receiving feedback.

For this course, we'll focus primarily on supervised learning, with some unsupervised learning in later modules.

## ▼ Part 2: Setting Up Our Machine Learning Environment

Let's start by importing our libraries and loading a dataset that will help us understand the ML workflow.

```
# Import essential libraries
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
```

```

import seaborn as sns
from sklearn.datasets import load_wine, make_classification
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
from sklearn.tree import DecisionTreeClassifier
from sklearn.metrics import accuracy_score, classification_report, confusion_matrix
from sklearn.preprocessing import StandardScaler
import warnings
warnings.filterwarnings('ignore')

# Set style for better-looking plots
plt.style.use('default')
sns.set_palette("husl")

print("✅ All libraries imported successfully!")
print("🚀 Ready to start our machine learning journey!")

```

✅ All libraries imported successfully!  
🚀 Ready to start our machine learning journey!

## Part 3: Loading and Exploring Our Dataset

We'll use the Wine dataset - a classic dataset for classification. It contains chemical analysis of wines from three different cultivars (types) grown in Italy.

```

# Chemical analysis breakdown of the first five different wines within the same wine class.
# Load the Wine dataset
wine_data = load_wine()

# Convert to DataFrame for easier handling
df = pd.DataFrame(wine_data.data, columns=wine_data.feature_names)
df['wine_class'] = wine_data.target
df['wine_class_name'] = [wine_data.target_names[i] for i in wine_data.target]

print("Dataset Information:")
print(f"Shape: {df.shape}")
print(f"Features: {len(wine_data.feature_names)}")
print(f"Classes: {wine_data.target_names}")
print(f"\nFirst 5 rows:")
print(df.head())

Dataset Information:
Shape: (178, 15)
Features: 13
Classes: ['class_0' 'class_1' 'class_2']

First 5 rows:
   alcohol  malic_acid    ash alcalinity_of_ash magnesium total_phenols \
0     14.23      1.71  2.43                 15.6       127.0          2.80
1     13.20      1.78  2.14                 11.2       100.0          2.65
2     13.16      2.36  2.67                 18.6       101.0          2.80
3     14.37      1.95  2.50                 16.8       113.0          3.85
4     13.24      2.59  2.87                 21.0       118.0          2.80

   flavanoids nonflavanoid_phenols proanthocyanins color_intensity    hue \
0        3.06            0.28           2.29         5.64    1.04
1        2.76            0.26           1.28         4.38    1.05
2        3.24            0.30           2.81         5.68    1.03
3        3.49            0.24           2.18         7.80    0.86
4        2.69            0.39           1.82         4.32    1.04

   od280/od315_of_diluted_wines    proline  wine_class wine_class_name
0                  3.92    1065.0       0      class_0
1                  3.40    1050.0       0      class_0
2                  3.17    1185.0       0      class_0
3                  3.45    1480.0       0      class_0
4                  2.93     735.0       0      class_0

```

```

# Explore the dataset structure
print("Dataset Overview:")
print("=" * 50)
print(f"Total samples: {len(df)}")
print(f"Features (input variables): {len(df.columns) - 2}"") # -2 for target columns
print(f"Target classes: {df['wine_class_name'].unique()}")
print(f"\nClass distribution:")
print(df['wine_class_name'].value_counts())

```

```
# Check for missing values
print(f"\nMissing values: {df.isnull().sum().sum()}")
print("✅ No missing values - this is a clean dataset!")

Dataset Overview:
=====
Total samples: 178
Features (input variables): 13
Target classes: [np.str_('class_0') np.str_('class_1') np.str_('class_2')]

Class distribution:
wine_class_name
class_1    71
class_0    59
class_2    48
Name: count, dtype: int64

Missing values: 0
✅ No missing values - this is a clean dataset!
```

## ▼ Part 4: Exploratory Data Analysis (EDA)

Before building models, we need to understand our data. This is a crucial step in the ML workflow.

```
# Visualize class distribution
plt.figure(figsize=(12, 4))

# Subplot 1: Class distribution
plt.subplot(1, 2, 1)
class_counts = df['wine_class_name'].value_counts()
plt.bar(class_counts.index, class_counts.values, color=['red', 'green', 'blue'])
plt.title('Distribution of Wine Classes')
plt.xlabel('Wine Class')
plt.ylabel('Number of Samples')
plt.xticks(rotation=45)

# Subplot 2: Feature correlation heatmap (first 6 features for clarity)
plt.subplot(1, 2, 2)
correlation_matrix = df.iloc[:, :6].corr()
sns.heatmap(correlation_matrix, annot=True, cmap='coolwarm', center=0, fmt='.2f')
plt.title('Feature Correlations (First 6 Features)')

plt.tight_layout()
plt.show()

print("📊 EDA helps us understand:")
print("- Class balance (are all classes equally represented?)")
print("- Feature relationships (which features are correlated?)")
print("- Data quality (any outliers or issues?)")
```

📊 EDA helps us understand:  
- Class balance (are all classes equally represented?)  
- Feature relationships (which features are correlated?)  
- Data quality (any outliers or issues?)

## ✓ Part 5: The Complete Machine Learning Workflow

Now let's implement the standard ML workflow step by step:

The 6-Step ML Workflow:

1. **Data Preparation:** Clean and prepare the data
2. **Feature Selection:** Choose relevant input variables
3. **Data Splitting:** Separate training and testing data
4. **Model Training:** Teach the algorithm using training data
5. **Model Evaluation:** Test performance on unseen data
6. **Model Interpretation:** Understand what the model learned

Let's implement each step!

```
# Step 1: Data Preparation
print("Step 1: Data Preparation")
print("=" * 30)

# Select features (X) and target (y)
# For simplicity, let's use the first 4 features
feature_names = ['alcohol', 'malic_acid', 'ash', 'alcalinity_of_ash']
X = df[feature_names]
y = df['wine_class']

print(f"Selected features: {feature_names}")
print(f"Feature matrix shape: {X.shape}")
print(f"Target vector shape: {y.shape}")

# Display first few rows
print("\nFirst 5 samples:")
print(X.head())
```

```
Step 1: Data Preparation
=====
Selected features: ['alcohol', 'malic_acid', 'ash', 'alcalinity_of_ash']
Feature matrix shape: (178, 4)
Target vector shape: (178,)

First 5 samples:
   alcohol  malic_acid    ash  alcalinity_of_ash
0      14.23        1.71  2.43          15.6
1      13.20        1.78  2.14          11.2
2      13.16        2.36  2.67          18.6
3      14.37        1.95  2.50          16.8
4      13.24        2.59  2.87          21.0
```

```
# Step 2: Data Splitting
print("Step 2: Data Splitting")
print("=" * 30)

# Split data into training (80%) and testing (20%) sets
X_train, X_test, y_train, y_test = train_test_split(
    X, y,
    test_size=0.2,      # 20% for testing
    random_state=42,    # For reproducible results
    stratify=y          # Maintain class proportions
)

print(f"Training set: {X_train.shape[0]} samples")
print(f"Testing set: {X_test.shape[0]} samples")
print(f"Training classes: {np.bincount(y_train)}")
print(f"Testing classes: {np.bincount(y_test)}")

print("\n⌚ Why split data?")
print("- Training set: Teach the model")
print("- Testing set: Evaluate performance on unseen data")
print("- This prevents overfitting (memorizing vs. learning)")
```

```
Step 2: Data Splitting
=====
Training set: 142 samples
Testing set: 36 samples
Training classes: [47 57 38]
```

Testing classes: [12 14 10]

⌚ Why split data?

- Training set: Teach the model
- Testing set: Evaluate performance on unseen data
- This prevents overfitting (memorizing vs. learning)

```
# Step 3: Model Training
print("Step 3: Model Training")
print("=" * 30)

# Create and train two different models
models = {
    'Logistic Regression': LogisticRegression(random_state=42),
    'Decision Tree': DecisionTreeClassifier(random_state=42, max_depth=3)
}

trained_models = {}

for name, model in models.items():
    print(f"\nTraining {name}...")

    # Train the model
    model.fit(X_train, y_train)
    trained_models[name] = model

    print(f"✅ {name} training completed!")

print("\n⌚ What happened during training?")
print("- Models learned patterns from training data")
print("- They found relationships between features and wine classes")
print("- Now they can make predictions on new data!")
```

Step 3: Model Training

=====

Training Logistic Regression...

✅ Logistic Regression training completed!

Training Decision Tree...

✅ Decision Tree training completed!

⌚ What happened during training?

- Models learned patterns from training data
- They found relationships between features and wine classes
- Now they can make predictions on new data!

```
# Step 4: Model Evaluation
print("Step 4: Model Evaluation")
print("=" * 30)
```

results = {}

```
for name, model in trained_models.items():
    # Make predictions
    y_pred = model.predict(X_test)
```

```
    # Calculate accuracy
    accuracy = accuracy_score(y_test, y_pred)
    results[name] = accuracy
```

```
    print(f"\n{name} Results:")
    print(f"Accuracy: {accuracy:.3f} ({accuracy*100:.1f}%)")
```

```
    # Detailed classification report
    print("\nDetailed Performance:")
    print(classification_report(y_test, y_pred, target_names=wine_data.target_names))
```

# Compare models

```
print("\n📊 Model Comparison:")
for name, accuracy in results.items():
    print(f"{name}: {accuracy:.3f}")
```

```
best_model = max(results, key=results.get)
print(f"\n🏆 Best performing model: {best_model}")
```

Step 4: Model Evaluation

=====

Logistic Regression Results:  
Accuracy: 0.889 (88.9%)

Detailed Performance:

	precision	recall	f1-score	support
class_0	1.00	1.00	1.00	12
class_1	0.81	0.93	0.87	14
class_2	0.88	0.70	0.78	10
accuracy			0.89	36
macro avg	0.90	0.88	0.88	36
weighted avg	0.89	0.89	0.89	36

Decision Tree Results:  
Accuracy: 0.833 (83.3%)

Detailed Performance:

	precision	recall	f1-score	support
class_0	0.86	1.00	0.92	12
class_1	0.91	0.71	0.80	14
class_2	0.73	0.80	0.76	10
accuracy			0.83	36
macro avg	0.83	0.84	0.83	36
weighted avg	0.84	0.83	0.83	36

### 📊 Model Comparison:

Logistic Regression: 0.889

Decision Tree: 0.833

🏆 Best performing model: Logistic Regression

```
# Step 5: Model Interpretation
print("Step 5: Model Interpretation")
print("=" * 30)

#Illustrates the progress of class prediction among wines based off of info. provided from dataset.
# Visualize confusion matrix for the best model
best_model_obj = trained_models[best_model]
y_pred_best = best_model_obj.predict(X_test)

plt.figure(figsize=(8, 6))
cm = confusion_matrix(y_test, y_pred_best)
sns.heatmap(cm, annot=True, fmt='d', cmap='Blues',
            xticklabels=wine_data.target_names,
            yticklabels=wine_data.target_names)
plt.title(f'Confusion Matrix - {best_model}')
plt.xlabel('Predicted Class')
plt.ylabel('True Class')
plt.show()

print(f"\n🔍 Interpreting the Confusion Matrix:")
print("- Diagonal values: Correct predictions")
print("- Off-diagonal values: Misclassifications")
print("- Perfect model would have all values on diagonal")
```

## Step 5: Model Interpretation

## 🕒 Interpreting the Confusion Matrix:

- Diagonal values: Correct predictions
- Off-diagonal values: Misclassifications
- Perfect model would have all values on diagonal

## ▼ Part 6: Understanding Different Data Types in ML

Machine learning works with various types of data. Let's explore the main categories:

```
# Data types assist in providing better description for different datasets.
# Understanding Different Data Types in ML
print("Understanding Data Types in Machine Learning")
print("=" * 45)

# Create examples of different data types
data_examples = {
    'Numerical (Continuous)': [23.5, 45.2, 67.8, 12.1, 89.3],
    'Numerical (Discrete)': [1, 5, 3, 8, 2],
    'Categorical (Nominal)': ['Red', 'Blue', 'Green', 'Red', 'Blue'],
    'Categorical (Ordinal)': ['Low', 'Medium', 'High', 'Medium', 'Low'],
    'Text': ['Hello world', 'Machine learning', 'Data science', 'Python programming', 'AI revolution'],
    'Boolean': [True, False, True, True, False]
}

for data_type, examples in data_examples.items():
    print(f"\n{data_type}:")
    print(f"  Examples: {examples}")
    print(f"  Use case: ", end="")

    if 'Continuous' in data_type:
        print("Regression problems (predicting prices, temperatures)")
    elif 'Discrete' in data_type:
        print("Counting problems (number of items, ratings)")
    elif 'Nominal' in data_type:
        print("Classification without order (colors, categories)")
    elif 'Ordinal' in data_type:
        print("Classification with order (ratings, sizes)")
    elif 'Text' in data_type:
        print("Natural language processing (sentiment analysis, translation)")
    elif 'Boolean' in data_type:
        print("Binary classification (yes/no, spam/not spam)")
```

```
print("\n💡 Key Insight: Different data types require different preprocessing and algorithms!")
```

---

**Understanding Data Types in Machine Learning**

---

**Numerical (Continuous):**  
 Examples: [23.5, 45.2, 67.8, 12.1, 89.3]  
 Use case: Regression problems (predicting prices, temperatures)

**Numerical (Discrete):**  
 Examples: [1, 5, 3, 8, 2]  
 Use case: Counting problems (number of items, ratings)

**Categorical (Nominal):**  
 Examples: ['Red', 'Blue', 'Green', 'Red', 'Blue']  
 Use case: Classification without order (colors, categories)

**Categorical (Ordinal):**  
 Examples: ['Low', 'Medium', 'High', 'Medium', 'Low']  
 Use case: Classification with order (ratings, sizes)

**Text:**  
 Examples: ['Hello world', 'Machine learning', 'Data science', 'Python programming', 'AI revolution']  
 Use case: Natural language processing (sentiment analysis, translation)

**Boolean:**  
 Examples: [True, False, True, True, False]  
 Use case: Binary classification (yes/no, spam/not spam)

💡 Key Insight: Different data types require different preprocessing and algorithms!

## ▼ Part 7: Hands-On Practice - Build Your Own Model

Now it's your turn! Complete the following tasks to reinforce your learning.

```
# Task 1: Try different features
print("Task 1: Experiment with Different Features")
print("=" * 40)

# Your task: Select 3 different features and build a model
# Available features:
print("Available features:")
for i, feature in enumerate(wine_data.feature_names):
    print(f"{i+1:2d}. {feature}")

# TODO: Replace these with your chosen features
your_features = ['alcohol', 'color_intensity', 'proline'] # Modify this list

# Build model with your features
X_your = df[your_features]
X_train_your, X_test_your, y_train_your, y_test_your = train_test_split(
    X_your, y, test_size=0.2, random_state=42, stratify=y
)

# Train a logistic regression model
your_model = LogisticRegression(random_state=42)
your_model.fit(X_train_your, y_train_your)

# Evaluate
y_pred_your = your_model.predict(X_test_your)
your_accuracy = accuracy_score(y_test_your, y_pred_your)

print(f"\nYour model features: {your_features}")
print(f"Your model accuracy: {your_accuracy:.3f} ({your_accuracy*100:.1f}%)")

# Compare with original model
print(f"Original model accuracy: {results['Logistic Regression']:.3f}")
if your_accuracy > results['Logistic Regression']:
    print("🎉 Great job! Your feature selection improved the model!")
else:
    print("🤔 Try different features to see if you can improve performance!")
```

---

Task 1: Experiment with Different Features

---

Available features:

1. alcohol

```

2. malic_acid
3. ash
4. alcalinity_of_ash
5. magnesium
6. total_phenols
7. flavanoids
8. nonflavanoid_phenols
9. proanthocyanins
10. color_intensity
11. hue
12. od280/od315_of_diluted_wines
13. proline

Your model features: ['alcohol', 'color_intensity', 'proline']
Your model accuracy: 0.833 (83.3%)
Original model accuracy: 0.889
💡 Try different features to see if you can improve performance!

```

## ▼ Part 8: Assessment - Understanding ML Concepts

Answer the following questions to demonstrate your understanding:

```

# Assessment Task 1: Identify the ML type
print("Assessment Task 1: Identify Machine Learning Types")
print("=" * 50)

# For each scenario, identify if it's Supervised, Unsupervised, or Reinforcement Learning

scenarios = [
    "Predicting house prices based on size, location, and age",
    "Grouping customers by purchasing behavior without knowing groups beforehand",
    "Teaching a robot to play chess by playing many games",
    "Classifying emails as spam or not spam using labeled examples",
    "Finding hidden topics in news articles without predefined categories"
]

# Your answers (replace 'TYPE' with Supervised, Unsupervised, or Reinforcement)
your_answers = [
    "Supervised",      # Scenario 1
    "Unsupervised",    # Scenario 2
    "Reinforcement",   # Scenario 3
    "Supervised",      # Scenario 4
    "Unsupervised"     # Scenario 5
]

# Check answers
correct_answers = ["Supervised", "Unsupervised", "Reinforcement", "Supervised", "Unsupervised"]

print("Scenario Analysis:")
score = 0
for i, (scenario, your_answer, correct) in enumerate(zip(scenarios, your_answers, correct_answers)):
    is_correct = your_answer == correct
    score += is_correct
    status = "✅" if is_correct else "❌"
    print(f"{status} {i+1}. {scenario}")
    print(f"  Your answer: {your_answer} | Correct: {correct}")
    print()

print(f"Score: {score}/{len(scenarios)} ({score/len(scenarios)*100:.0f}%)")

```

```

Assessment Task 1: Identify Machine Learning Types
=====
Scenario Analysis:
✅ 1. Predicting house prices based on size, location, and age
  Your answer: Supervised | Correct: Supervised

✅ 2. Grouping customers by purchasing behavior without knowing groups beforehand
  Your answer: Unsupervised | Correct: Unsupervised

✅ 3. Teaching a robot to play chess by playing many games
  Your answer: Reinforcement | Correct: Reinforcement

✅ 4. Classifying emails as spam or not spam using labeled examples
  Your answer: Supervised | Correct: Supervised

✅ 5. Finding hidden topics in news articles without predefined categories
  Your answer: Unsupervised | Correct: Unsupervised

```

## Part 9: Real-World Applications and Case Studies

Let's explore how the concepts we've learned apply to real-world scenarios.

### Case Study 1: Recommendation Systems (Netflix, Amazon)

**Problem:** Suggest movies/products users might like **ML Type:** Hybrid (Supervised + Unsupervised + Reinforcement) **Data:** User ratings, viewing history, product features **Workflow:** Collect data → Build user profiles → Train models → Make recommendations → Learn from feedback

### Case Study 2: Fraud Detection (Banks, Credit Cards)

**Problem:** Identify fraudulent transactions **ML Type:** Supervised Learning (Classification) **Data:** Transaction amounts, locations, times, merchant types **Workflow:** Historical fraud data → Feature engineering → Train classifier → Real-time scoring → Continuous monitoring

### Case Study 3: Medical Diagnosis (Healthcare)

**Problem:** Assist doctors in diagnosing diseases **ML Type:** Supervised Learning (Classification) **Data:** Medical images, patient symptoms, lab results **Workflow:** Labeled medical data → Image processing → Train deep learning models → Clinical validation → Deployment with human oversight

### Your Turn: Think of Applications

Consider these industries and think about how ML could be applied:

- **Transportation:** Autonomous vehicles, route optimization
- **Agriculture:** Crop monitoring, yield prediction
- **Education:** Personalized learning, automated grading
- **Entertainment:** Content creation, game AI

## Part 10: Complete ML Workflow Summary

Let's summarize the complete machine learning workflow we've learned:

### The Machine Learning Lifecycle

1. Problem Definition  
↓
2. Data Collection & Exploration  
↓
3. Data Preprocessing & Feature Engineering  
↓
4. Model Selection & Training  
↓
5. Model Evaluation & Validation  
↓
6. Model Deployment & Monitoring  
↓
7. Continuous Improvement

### Checklist for Every ML Project:

#### Data Phase:

- Understand the problem and define success metrics
- Collect and explore the dataset
- Check for missing values, outliers, and data quality issues
- Visualize data to understand patterns and relationships

#### Modeling Phase:

- Split data into training and testing sets
- Select appropriate algorithms for the problem type
- Train multiple models and compare performance

- Evaluate using appropriate metrics (accuracy, precision, recall, etc.)

### Deployment Phase:

- Validate model performance on new data
- Document the model and its limitations
- Deploy responsibly with monitoring systems
- Plan for model updates and maintenance

### ⌚ Key Takeaways:

- Start Simple:** Begin with basic models before trying complex ones
- Understand Your Data:** EDA is crucial for success
- Validate Properly:** Always test on unseen data
- Iterate:** ML is an iterative process of improvement
- Document Everything:** Keep track of experiments and results

## Your Reflection and Analysis

**Instructions:** Complete the reflection below by editing this markdown cell.

### My Understanding of Machine Learning Types

**Supervised Learning:** The computer learns from provided data examples/ correct answers and uses this as a guide to make predictions on new data.

**Unsupervised Learning:** The computer is provided random data with no answers and must find the pattern of correlation.

**Reinforcement Learning:** The computer improves its algorithm by trial-and-error through receiving feedback to improve.

### My Analysis of the Wine Classification Project

**Best performing model:** Logistic Regression

**Why do you think this model performed better?:** I think Logistic Regression performed better since the wine classes can be clearly defined by the different wine features without overfitting.

**What would you try next to improve performance?:** I could add features that are more descriptive to the different wine classes to improve separation and distinguish patterns better.

### Real-World Application Ideas

**Industry of Interest:** The industry of interest is the video gaming industry,

**ML Problem:** The ML problem is to predict a game's genre from labeled features.

**Type of ML:** This would be supervised learning.

**Data Needed:** Some important pieces of data to be collected are: Publisher, Graphic style, combat type, player count, and story complexity.

### Key Learnings

**Most important concept learned:** I would say learning about the different ML models for supervised learning is important because they help to compare information and better classify features.

**Most challenging part:** The most challenging part of this assignment was understanding how the data is setup in the code to make predictions and classifications.

**Questions for further exploration:** How can this same data be used in different types of ML?

## Lab Summary and Next Steps

### ⌚ What You've Accomplished:

- Understood ML Types:** Supervised, Unsupervised, and Reinforcement Learning
- Mastered ML Workflow:** Data → Model → Evaluation → Insights
- Built Classification Models:** Logistic Regression and Decision Trees
- Evaluated Model Performance:** Accuracy, Confusion Matrix, Classification Report

**Worked with Real Data:** Wine dataset analysis and modeling

**Applied Best Practices:** Data splitting, model comparison, interpretation

## Preparation for Module 4:

In the next lab, you'll dive deeper into:

- **Exploratory Data Analysis (EDA):** Advanced visualization techniques
- **Data Quality Assessment:** Handling missing values, outliers, and duplicates
- **Statistical Analysis:** Understanding distributions and relationships
- **Data Storytelling:** Communicating insights effectively

## Action Items:

1. **Upload this notebook** to your GitHub repository
2. **Experiment** with different features in the wine dataset
3. **Try other datasets** from sklearn.datasets (digits, breast\_cancer, boston)
4. **Practice** the 6-step ML workflow on a new problem
5. **Document** your experiments and findings

## Additional Resources:

- [Scikit-learn User Guide](#)
- [Machine Learning Mastery](#)
- [Kaggle Learn](#) - Free micro-courses
- [Google's Machine Learning Crash Course](#)

## Reflection Questions:

1. Which type of machine learning (supervised/unsupervised/reinforcement) interests you most and why?
2. What was the most challenging part of the ML workflow for you?
3. How might you apply these concepts to a problem in your field of interest?
4. What questions do you have about machine learning that you'd like to explore further?

**Congratulations on completing Module 3! You've taken a significant step in your machine learning journey.**

*Remember: Machine learning is a skill that improves with practice. Keep experimenting, stay curious, and don't be afraid to make mistakes*
